Water Item - Mixing Units of Gallons

Q. When loading water out of the facility, it is metered out by the gallon. However, the default water item's mixing units cannot be edited in *Item Information*. Also, the mix in mixing units are selected on the Material Group.

A. The default Water item in form-U-net has some complex blending calculation models that dictate that the *Request Unit* and *Mixing Unit* be set to *Pound*. Those units are not editable.

To fix this, another water item may be added to form-U-net with a different item code, such as H2O. The *Mixing Unit* on this new item may be set to *Gallon*. Remove the default Water item from the Material Group and replace it with the new item.
