Bug Fixes

- **SKYC-4098 / Out Of Sync Offline Status** – The *Start*, *Postpone*, *Complete*, and *Refresh* buttons now correctly enable and disable based on the actual network status.
 - **Why** – These buttons could appear disabled while in Online Mode when the app's network status became out of sync with the device's actual connectivity state, preventing Drivers and Applicators from taking action on their jobs.
 - **When/Where** – When viewing jobs in the Agvance Ops while transitioning between online and offline connectivity.
 - **Action Needed** – No action required.
- **SKYC-4107 / StartTime and EndTime Error** – Job start and end times are now accurately captured when starting and completing jobs without conditions.
 - **Why** – Start and end times could be set incorrectly on jobs completed without conditions, and tickets that already contained empty start or end time values were not being updated.
 - **When/Where** – When starting and completing jobs without conditions in the Agvance Ops.
 - **Action Needed** – No action required.

New Features

- **SKYC-4077 / Paginate Vehicle List** – The *Vehicle* list is now paginated to support faster loading.
 - **Why** – Larger databases and expanding customer fleets could slow down list loading. Pagination improves performance and responsiveness for users selecting a vehicle.
 - **When/Where** – When viewing the *Vehicle* list in the Agvance Ops.
 - **Action Needed** – No action required.
- **SKYC-4076 / Offline Mode Disable Applicator Settings** – *Vehicle* and *Condition Profile* settings are now disabled while operating in Offline Mode.
 - **Why** – These settings were previously accessible in Offline Mode but relied on a live connection, which could lead to confusion or incomplete changes.
 - **When/Where** – When Applicators, Delivery Drivers, and Tender Drivers access Settings while in Offline Mode in the Agvance Ops.
 - **Action Needed** – No action required.
- **SKYC-3603 / Capture Additional Weather Data Conditions** – Additional forecast values are now captured automatically alongside other weather conditions.
 - **Why** – This saves Applicators time and reduces manual entry errors by automatically capturing required forecast data for compliance records.

- **When/Where** – When weather conditions are captured in the Agvance Ops, the following values are now included when available: *24 Hour Precipitation Forecast*, *24 Hour Temperature Forecast*, *48 Hour Precipitation Forecast*, and *48 Hour Temperature Forecast*.
- **Action Needed** – No action required.
- **SKYC-4087 / Location Tracking Cleanup** – The location tracking service has been cleaned up and optimized.
 - **Why** – Backend improvements make the service more maintainable and easier to update going forward, supporting more reliable location tracking.
 - **When/Where** – This applies to location tracking across the Agvance Ops.
 - **Action Needed** – No action required.
- **SKYC-4093 / Incorrect Application Zone** – Application zones imported from SKY Mapping recommendations now display correctly in the Agvance Ops.
 - **Why** – When a recommendation covering an entire field was imported into a Blend Ticket, a small polygon could incorrectly appear as outside the application zone in the Agvance Ops, even though the zone displayed correctly in SKY Mapping, Legacy Agvance, and SKY Dispatch.
 - **When/Where** – When viewing application zones on job maps in the Agvance Ops for tickets using imported recommendations.
 - **Action Needed** – No action required.
- **SKYC-4103 / Fix Signature Complete Job** – Job completion with signatures has been updated to use the improved Blend Ticket API.
 - **Why** – Previously, if a blend field was updated while a ticket was stored locally, the signature patch could fail because the blend field's unique ID had changed. The updated API uses a consistent identifier to reliably apply signature updates at job completion.
 - **When/Where** – When completing jobs that include a signature in the Agvance Ops.
 - **Action Needed** – No action required.
