

Getting Started with Blending - Educational Pathway

Last Modified on 10/08/2026 8:00 am CDT

Get started with Blending in Windows Agvance and Agvance SKY with relevant links and descriptions below.

Setup

- **Blending Startup** – Use this guide to ensure the data is set up correctly.
- **Using Crop Chemistry** – Indicating the ticket is a certain chemistry allows the Blend Ticket to be assigned to the correct sprayer and helps avoid crop damage from incorrect application.
- **Product Sets Setup** – Product Sets are groups of inventory items often combined as blended products. This involves grouping fertilizer or other products (i.e. water, clay, or dry filler) typically used when filling a requested analysis or nutrient recommendation. See [Product Sets - Blending](#) for more information on setup in Agvance Windows and [Product Sets - Agvance SKY Order](#) for more information on setting up in Agvance SKY.
- **Location Preferences** – Preferences allow options to be set, therefore customizing to a degree how the program works for the company.
- **Placement** – Placement is used for report filtering and to provide information.

Product Setup

- **Product Setup** – Inventory Products and services (such as custom application) are entered in the Product file. Products can be set up in [Agvance SKY Product](#) and [Agvance Windows](#).
- **Agrian Interface Setup** – Agrian is a web-based DOT regulatory data option that allows Agrian Recommendations to be imported into Agvance Delivery Tickets and Blend Tickets, updates the *Product Profile*, *Safety*, and *Blend Setup* tabs, and provides current DOT information for Hazmats, WPS, MSDS, and Labels.
